

Crop: Onion
Trial Size: 2 Hectare
Trial Location: Bunbury
Start Date: 22-Nov-2009
Product: Hibrix BB
Application Rate: 5L per hectare

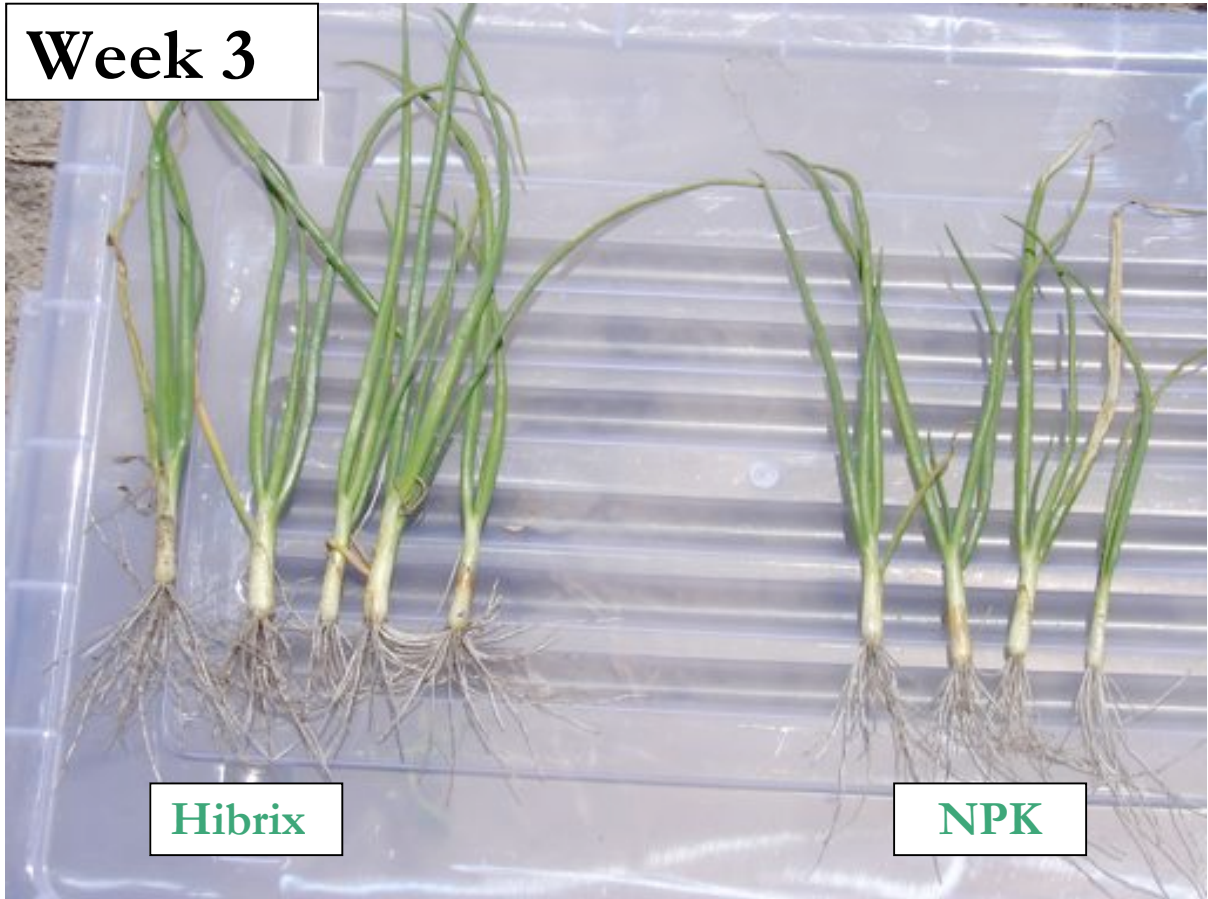

Results

Throughout the trial the Hibrix plots maintained an average brix reading 26% higher than the standard NPK plots.

As well as a 10% increase in overall tonnage, there was an increase in percentage of high-grade onions. High-grade onions demand a premium in the market

The Hibrix plots needed two applications of pesticide for thrips. Non Hibrix lots required five applications. This represents a significant saving.
